Secretariat:

Information technology — JPEG 2000 image coding system — Part 12: ISO base media file format, TECHNICAL CORRIGENDUM 2

Élément introductif — Élément central — Partie 12: Titre de la partie

Document type: International Standard
Document subtype: Technical Corrigendum
Document stage: (30) Committee
Document language: E

STD Version 2.1c2

Technical Corrigendum 4 to ISO/IEC 15444-12:2008 was prepared by Joint Technical Committee ISO/IEC JTC 1, *Information Technology*, Subcommittee SC 29, *Coding of Audio, Picture, Multimedia and Hypermedia Information*.

In 8.5.2.1 replace

A TextSubtitleSampleEntry, TextMetaDataSampleEntry, or SimpleTextSampleEntry, all of which contain a MIME type, may be used to identify the format of streams for which a MIME type applies. A MIME type applies if the contents of a set of samples, starting with a sync sample and ending at the sample immediately preceding a sync sample, are concatenated in their entirety, and the result meets the decoding requirements for documents of that MIME type. Non-sync samples should be used only if that format specifies the behaviour of 'progressive decoding', and then the sample times indicate when the results of such progressive decoding should be presented (according to the media type).

> NOTE the samples in a track that is all sync samples are therefore each a valid document for that MIME type.

with

A TextSubtitleSampleEntry, TextMetaDataSampleEntry, or SimpleTextSampleEntry, all of which contain a MIME type, may be used to identify the format of streams for which a MIME type applies. A MIME type applies if the contents of the string in the optional configuration box (without its null termination), followed by the contents of a set of samples, starting with a sync sample and ending at the sample immediately preceding a sync sample, are concatenated in their entirety, and the result meets the decoding requirements for documents of that MIME type. Non-sync samples should be used only if that format specifies the behaviour of 'progressive decoding', and then the sample times indicate when the results of such progressive decoding should be presented (according to the media type).

> NOTE the samples in a track that is all sync samples are therefore each a valid document for that MIME type.

In 8.5.2.2, replace:

```
class TextMetaDataSampleEntry() extends MetaDataSampleEntry ('mett') {
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox (); // optional
}
```

with

```
class TextConfigBox() extends Fullbox ('txtC', 0, 0) {
   string   text_config;
}

class TextMetaDataSampleEntry() extends MetaDataSampleEntry ('mett') {
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox (); // optional
   TextConfigBox (); // optional
}
```

and replace

```
class SimpleTextSampleEntry(codingname) extends PlainTextSampleEntry (codingname)
{
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox ();             // optional
}
```

with

```
class SimpleTextSampleEntry(codingname) extends PlainTextSampleEntry (codingname
'stxt') {
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox ();              // optional
   TextConfigBox ();           // optional
}
```

and replace

```
class TextSubtitleSampleEntry() extends SubtitleSampleEntry ('sbtt') {
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox ();              // optional
}
```

with

```
class TextSubtitleSampleEntry() extends SubtitleSampleEntry ('sbtt') {
   string   content_encoding; // optional
   string   mime_format;
   BitRateBox ();              // optional
   TextConfigBox ();           // optional
}
```

In 8.5.2.3, after:

`mime_format` - provides a MIME type, in null-terminated UTF-8 characters, which identifies the content format of the samples. Examples for this field include 'text/html' and 'text/plain'.

insert

`text_config` - provides the initial text of each document, in null-terminated UTF-8 characters, which is prepended before the contents of each sync sample.

In 8.11.6.1 replace

If file delivery item information is needed and a version 2 or 3 ItemInfoEntry is used, then the file delivery information is stored (a) as a separate item of type 'fdel') that is also (b) linked by an item reference from the item, to the file delivery information, of type 'fdel'. There must be exactly one such reference if file delivery information is needed.

with

If file delivery item information is needed and a version 2 or 3 ItemInfoEntry is used, then the file delivery information is stored ~~(a)~~ as a separate item of type 'fdel'~~)~~ that is also ~~(b)~~ linked by an item reference from the item, to the file delivery information, of type 'fdel'. There must be exactly one such reference if file delivery information is needed.

In 8.16.3.3, replace

`earliest_presentation_time` is the earliest presentation time of any access unit in the reference stream in the first subsegment, in the timescale indicated in the timescale field;

with

`earliest_presentation_time` is the earliest presentation time of any ~~access unit~~content in the reference stream in the first subsegment, in the timescale indicated in the timescale field; the earliest presentation time is derived from media in access units, or parts of access units, that are not omitted by an edit list (if any);
