[MS-UPIGD]: UPnP Device and Service Templates: Internet Gateway Device (IGD) Extensions

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft Open Specification Promise or the Community Promise. If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting iplq@microsoft.com.
- Trademarks. The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

Revision Summary

1 Introduction

The UPnP: Device & Service Templates: Internet Gateway Device (IGD) Extensions describe extensions to the Universal Plug-n-Play (UPnP) device schema that describes an Internet gateway device.

Sections 1.7 and 2 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. All other sections and examples in this specification are informative.

1.1 Glossary

The following terms are defined in [MS-GLOS]:

computer name

The following terms are specific to this document:

action: As defined in [UPNPARCH1.1] section i.7, a command exposed by a service.

event: As defined in [UPNPARCH1.1] section i.7, a notification of one or more changes in state variables exposed by a **service**.

interface alias: As defined in [RFC2863] section 6, a human-readable name that is associated with a network interface, and configurable by a network manager.

Internet gateway device: An interconnect device between a local area network (LAN) and a wide area network (WAN), typically providing connectivity to the Internet.

service: A logical functional unit, as defined in [UPNPARCH1.1] section i.7. A service exposes actions and models the state of a device with state variables.

service description: As defined in [UPNPARCH1.1] section i.7, the formal definition of a **service**, expressed in the UPnP Template Language defined in [UPNPARCH1.1] section 2.6.

1.2 References

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

1.2.2 Informative References

[MS-GLOS] Microsoft Corporation, "Windows Protocols Master Glossary".

[RFC2863] McCloghrie, K., and Kastenholz, F., "The Interfaces Group MIB", RFC 2863, June 2000, http://www.ietf.org/rfc/rfc2863.txt?number=2863.txt

1.3 Overview

The **Internet gateway device** (IGD) extensions specified in this document comprise four UPnP services:

- 1. OSInfo is a new service implemented on an IGD that enables retrieval of information about the operating system running on the IGD.
- 2. The WANCommonInterfaceConfig service [UPNPWCIC] service is extended to implement an **action** that returns uptime information along with usage statistics. Previously this service returned only the usage statistics, requiring the caller to use its own timestamp for rate estimation. However, using the client's timestamp of the reception of the information introduces additional uncertainty due to queuing and propagation delays that may vary by message. Including the IGD's uptime value in the data instead enables more accurate rate estimation.
- 3. The WANIPConnection service [UPNPWIPC] is extended to add a state variable that enables customization of the name of the **interface alias** on the WAN interface of the Internet gateway device.
- 4. The WANPPPConnection service [UPNPWPPC] is extended to add a state variable that enables customization of the name of the interface alias on the WAN interface of the Internet gateway device.

1.4 Relationship to Protocols and Other Structures

The interface alias of the WAN interface is manageable with either the WANIPConnection service or the WANIPConnection service (depending on the type of WAN connection). This same state variable may also be exposed via other mechanisms, such as the Interfaces Group MIB [RFC2863].

1.5 Applicability Statement

The IGD extensions specified in this document are applicable only to an IGD that has a single WAN interface.

1.6 Versioning and Localization

There are no localization-dependent structures specified in this document.

1.7 Vendor-Extensible Fields

None.

5 / 30

2 Structures

Data types used in this document are specified in [UPNPARCH1.1] section 2.5.

2.1 OSInfo Service

The OSInfo Service is a service in the Internet gateway device (IGD). Its **service description** is specified as follows, in the UPnP Template Language as defined in [UPNPARCH1.1] section 2.6.

```
<?xml version="1.0"?>
<scpd xmlns="urn:schemas-upnp-org:service-1-0">
 <specVersion>
    <major>1</major>
    <minor>0</minor>
  </specVersion>
  <actionList>
   <action>
     <name>MagicOn</name>
    </action>
  </actionList>
  <serviceStateTable>
    <stateVariable>
     <name>OSMajorVersion</name>
      <dataType>i4</dataType>
    </stateVariable>
    <stateVariable>
      <name>OSMinorVersion</name>
      <dataType>i4</dataType>
    </stateVariable>
    <stateVariable>
      <name>OSBuildNumber</name>
     <dataType>i4</dataType>
    </stateVariable>
    <stateVariable>
      <name>OSMachineName</name>
      <dataType>string</dataType>
    </stateVariable>
  </serviceStateTable>
</scpd>
```

The following action is defined in the service description above:

MagicOn: A placeholder action created solely to provide a properly formed UPnP service description. The MagicOn action provides no functionality and always returns success.

The following state variables are defined in the service description above:

OSMajorVersion: The major version of the operating system.

OSMinorVersion: The minor version of the operating system.

OSBuildNumber: The build number of the operating system.

OSMachineName: The **computer name** of the Internet gateway device.

2.2 WANCommonInterfaceConfig Extensions

The WANCommonInterfaceConfig service is specified in [UPNPWCIC]. Its service description is extended as follows, in the UPnP Template Language.

```
<actionList>
<action>
   <name>X GetICSStatistics</name>
      <argumentList>
        <argument>
         <name>TotalBytesSent</name>
          <direction>out</direction>
          <relatedStateVariable>TotalBytesSent</relatedStateVariable>
        </argument>
        <argument>
          <name>TotalBytesReceived</name>
          <direction>out</direction>
          <relatedStateVariable>TotalBytesReceived</relatedStateVariable>
        </argument>
        <argument>
          <name>TotalPacketsSent</name>
          <direction>out</direction>
          <relatedStateVariable>TotalPacketsSent</relatedStateVariable>
        <argument>
          <name>TotalPacketsReceived
          <direction>out</direction>
          <relatedStateVariable>TotalPacketsReceived/relatedStateVariable>
        </argument>
        <argument>
          <name>Layer1DownstreamMaxBitRate</name>
          <direction>out</direction>
          <relatedStateVariable>Layer1DownstreamMaxBitRate/relatedStateVariable>
        </argument>
        <argument>
          <name>Uptime</name>
          <direction>out</direction>
          <relatedStateVariable>X_Uptime</relatedStateVariable>
        </argument>
      </argumentList>
    </action>
</actionList>
<serviceStateTable>
    <stateVariable sendEvents="no">
      <name>X PersonalFirewallEnabled</name>
      <dataType>boolean</dataType>
   </stateVariable>
   <stateVariable sendEvents="no">
      <name>X Uptime</name>
      <dataType>ui4</dataType>
   </stateVariable>
</serviceStateTable>
```

The following action is defined in the service description above:

X_GetICSStatistics: Provides the ability to retrieve uptime information for an Internet gateway device. This action uses the following errors:

7 / 30

```
[MS-UPIGD] — v20140502
UPnP Device and Service Templates: Internet Gateway Device (IGD) Extensions
```

Copyright © 2014 Microsoft Corporation.

Value	Meaning	
402	Invalid Args, as defined in [UPNPWCIC] section 2.4.1.4.	
501	Action Failed, as defined in [UPNPWCIC] section 2.4.1.4.	

The following state variables are defined in the service description above:

X_Uptime: The number of seconds since the IGD has started. This is the same value as the *Uptime* variable in the WANIPConnection or WANPPPConnection service.

X_PersonalFirewallEnabled: If the WAN interface on the Internet gateway device is protected by a firewall, this SHOULD<1> be set to TRUE; otherwise FALSE.

2.3 WANIPConnection Extensions

The WANIPConnection service is specified in [UPNPWIPC]. Its service description is extended as follows, in the UPnP Template Language.

The following state variable is defined in the service description above:

X_Name: The interface alias of the external (WAN) interface of the Internet gateway device.

2.4 WANPPPConnection Extensions

The WANPPPConnection service is specified in [UPNPWPPC]. Its service description is extended as follows, in the UPnP Template Language.

```
<serviceStateTable>
  <stateVariable sendEvents="yes">
        <name>X_Name</name>
        <dataType>string</dataType>
        </stateVariable>
</serviceStateTable>
```

The following state variable is defined in the service description above:

X_Name: The interface alias of the external (WAN) interface of the Internet gateway device.

3 Structure Examples

3.1 OSInfo

In this example, the IGD is named "SAMPLE-IGD", and a client retrieves operating system information. It does so as follows.

- The client discovers the XML schema for the OS info service as specified in [UPNPARCH1.1] section 1.
- 2. The IGD responds with the OSInfo service description specified in section 2.1.
- 3. The client then invokes the MagicOn action on the OSInfo service.
- 4. The IGD responds with the following data.

```
<?xml version="1.0"?>
<e:propertyset xmlns:e="urn:schemas-upnp-org:event-1-0">
<e:property><OSMajorVersion xmlns:dt="urn:schemas-microsoft-com:datatypes"
dt:dt="i4">6</OSMajorVersion></e:property>
<e:property><OSMinorVersion xmlns:dt="urn:schemas-microsoft-com:datatypes"
dt:dt="i4">1</OSMinorVersion></e:property>
<e:property><OSBuildNumber xmlns:dt="urn:schemas-microsoft-com:datatypes"
dt:dt="i4">7600</OSBuildNumber></e:property>
<e:property><OSMachineName xmlns:dt="urn:schemas-microsoft-com:datatypes"
dt:dt="string">SAMPLE-IGD</OSMachineName></e:property>
</e:property><</e:property></e:property></e:property></e:property></e:property></e:property></e:property></e:property></e:property></e>
```

3.2 WANCommonInterfaceConfig

In the example below, the client computes rate information across a 5-second period of time.

- 1. The client invokes the WANCommonInterfaceConfig service with action X_GetICSStatistics.
- 2. The IGD returns statistics, including an uptime in the X_Uptime variable.
- 3. The client remembers the first set of results, and waits for 5 seconds.
- 4. The client again invokes WANCommonInterfaceConfig service with action X_GetICSStatistics.
- 5. The IGD returns statistics, including an uptime in the X_Uptime variable.
- The client then uses the two sets of information to compute rate information. For example, incoming bandwidth usage would be (currrent TotalBytesReceived previous TotalBytesReceived) / (current X_Uptime previous X_Uptime).

4 Security

4.1 Security Considerations for Implementers

This document has the same security considerations as those defined in [UPNPARCH1.1].

It should be noted the OS_MachineName could be considered private information. Also operating system version number information could be used to fingerprint the device in order to identify potential vulnerabilities.

4.2 Index of Security Fields

None.

5 Appendix A: XML schema

The full service description for the OSInfo service appears in section 2.1. The full service descriptions for the services extended are given in the following sections.

5.1 WAN Common Interface Config

```

6 Appendix B: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Windows XP operating system
- Windows Server 2003 operating system
- Windows Vista operating system
- Windows Server 2008 operating system
- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> Section 2.2: Windows XP and Windows Server 2003 set X_PersonalFirewallEnabled to TRUE, if the Internet connection firewall is enabled on the WAN interface of the gateway device. If any other firewall is used, X_PersonalFirewallEnabled is set to FALSE. All other versions of Windows always set X_PersonalFirewallEnabled to FALSE.

7 Change Tracking No table of changes is available. The document is either new or has had no changes since its last release.

Release: Thursday, May 15, 2014
