140
       别名一旦更改可以保存在驱动器E2PROM中,配置好后可以下次直接使用,多轴控制的时候可以配置不同的别名信息区分不同的轴
        7. 操作模式设置 (CoE INDEX:SUBINDEX 0x0600:0x00 )
       ethercat download -a 0 -p 0 0x6060 0x00 0x01
        9. 自由运行模式(手册P221)
        root@linaro-ubuntu-desktop:/home/linaro/ftp/wuliang# ethercat download -a 0 -p 0 -t uint8 0x1c32 0x01 0x00
       10. DC模式不能进入OP模式的可能原因?
DC模式一般用于实时性较高的场合,主站实时性要求非常高,一般高实时性场合Slaves要求时间抖动不超过100us
       11. 通过ethercat让电机力矩
       11.1 设置自由模式
       ethercat download -a 0 -p 0 -t uint8 0x1c32 0x01 0x00
设置力矩模式:
169
170
        ethercat download -a 0 -p 0 -t uint8 0x6060 0x00 0x04
       11.2 设置驱动器成'OP'模式
ethercat states -a 0 -p 0 OP
       181
182
       ethercat download -a 0 -p 0 -t uint16 0x6071 0x00 0x001c
以负力矩转动:
       188
189
       OP模式下进行一些对象字典设置会有如下报错:
root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat download -a 0 -p 0 -t uint8 0x6060
       EtherCAT ERROR 0-0: Reception of COE download response failed: No response. EtherCAT ERROR 0-0: Failed to process SDO request. Failed to download SDO: Input/output error
       原因是OP模式不能更改一些寄存器器的值所以会包上述错误
       13.非'OP'模式力矩测试问题
经测试发现非'OP'模式下也可以设置电机力矩控制
       Ethercat控制OUT2输出
ethercat download -a 0 -p 0 -t uint32 0x60fe 0x01 0x00020000
       Ethercat同时控制OUT1,0UT2输出
ethercat download -a 0 -p 0 -t uint32 0x60fe 0x01 0x00030000
208
209
210
       OUT1输出OFF((刹车抱死))
ethercat download -a 0 -p 0 -t uint8 0x20f9 0x02 0x43
```

```
OUTPUT----RxPdo 映射对象字典原始数据读取
         ethercat upload -a 0 -p 0 -t uint32 0x607a 0x00 ethercat upload -a 0 -p 0 -t uint32 0x6081 0x00

         15.发生报警时根据手册P420页内容逐步排查原因
15.1 任务处理异常
         (1)要先配9x664d:8x80=8x86,让伺服驱动处于ShutDown状态 山羊电机手册 P229
(2)没有进行pdo映射的对象字典要通过sdo方式先进行配置
(3)sdo配置对象字典要在主站激活前进行
          (4)所有配置完成, 主机激活完成通过PDO方式配置0x6040:0x00=0x07,使能主机
          0x00000002 2
269
270
         TwinCat 配置泰科伺服
1 ,要在配置模式进行对象字典的配置
          root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat download -a 255 -p 0 -t uint8 0x606 root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat download -a 255 -p 0 -t uint16 0x60
          root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat download -a 255 -p 0 -t uint16 0x60
root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat upload -a 255 -p 0 -t uint16 0x6041
          root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat download -a 255 -p 0 -t uint16 0x60
root@linaro-ubuntu-desktop:/home/linaro/ftp/ethercat-1.5.2/test# ethercat upload -a 255 -p 0 -t uint16 0x6041
280
          0x0670 1648
通过调试软件使能JOG后
          root@linaro-ubuntu-desktop:~# ethercat upload -a 255 -p 0 -t uint16 0x6041 0x00
290
291
          0x6076 额定输出力矩值
         最大力矩 = 额定输出力矩值 * 3
泰科模组Ethercat调试
299
300
          可以正常以力矩模式控制泰科电机的命令序列
         ethercat download -a 255 -p 0 -t uint16 0x1c32 0x01 0x00 ethercat states -a 255 -p 0 0P
 308
          4. 设置输出目标力矩, 电机旋转
          5.输出力矩0电机
325
326
         1.进行PDO映射的对象字典要在OP模式下更改才会生效,否则可能即使更改成功了也会不起作用
2.没有进行PDO映射的对象字典在OP模式下读写可能会发生错误
         对象字典使用PDO还是SDO方式进行操作?
SDO一般用于配置从站值息,PDO方式一般用于同从站进行实时数据交互,SDO方式主从站需要交互确认机制因而费时
 334

```

#### 1. libethercat\std 目录

1 编译Igh生成的ethecat库

### 2. libethercat\include

```
1 Igh Master Ethercat库包含的头文件
```

#### 3. scripts/

```
1 自动生成从站信息的相关脚本文件,要生成从站信息,将该文件夹复制到开发板运行GenerateSlavesConfig.sh。
2 默认生成ec_common_configs_define.htplec_common_configs_define.c文件,这两个文件会在libethercat\ec_common\ecat_common
```

## 4. libethercat\ec\_common

## 4.0

```
ec_common_configs_define.h

c_common_configs_define.c

d脚本scripts/GenerateSlavesConfig.sh自动生成的从站信息,包括从站PDO,SDO设置

4 等,更具体的可以参照scripts/README.txt
```

#### 4.1

```
1 ecat_common.h
2 ecat_common.c
3 基于ibethercat\std 中的库的二次封装库,简化了PDD,SDD等操作
```

## 4.2

```
1 ecat_common_intermediate_interface.h
2 ecat_common_intermediate_interface.h
2 ecat_common_intermediate_interface.c
3 与具体一部相关的按口库,基于ecat_common.c中按口的实现,不同设备修改这两个文件中的按口进行适配。
4 目前该文件实现的山羊电机接口,主要实现的PDO接口的电机状态查询,上电开机,关机,操作模式设置,力矩设置等接口,不同电机的类似。
5 封装接口的关键是对象字典的操作,根据手册设置对象字典即可,标准的Ethercat接口伺服电机一般来说对象字典定义基本是一样的,可能
```

## 5. 标准Igh Master接口的使用例子

### mytest目录

# 6.二次封装接口库ecat\_common\_intermediate\_interface.c的使用说明

#### 6.1使用步骤

1 (1)将编译生成的Igh库文件替换libethercat\std文件 ,文件名可能要改成,或者不该也行,自己写Makefile时匹配库名称就行

```
2 (2)称 scripts/ 目录复制到开发运行enerateSlavesConfig.sh脚本,将脚本生成的ec_common_configs_define.h ec_common_confi
3 (3)基于二次封装接口的电机一般操作步骤
4 無限をmo.c中的ethercat_init() 进行从站初始化
5 放射化后就可以调用ecat_common_intermediate_interface.c中接口対从站进行操作
比如
6 比如
7 interpolation_2_ecat_set_slave_pwr_on()接口使能电机,
interpolation_2_ecat_set_slave_pwr_off() 关闭电机
9 interpolation_2_ecat_set_slave_pwr_off() 关闭电机
10 其它按口作用见参照具体实现
2 |
```

## 7.关于轴操作的几点说明

```
1 (1) 每个轴对应一个从始,由alias,position确定,一般来说从站不多的alias=0固定不变,对不同轴根据positon确定。
2 例如使能和关闭不同的轴
    int interpolation_2_ecat_set_slave_pwr_on(MasterSpecifiedInfo_T *master_specified_info, int slave_pos);
    int interpolation_2_ecat_set_slave_pwr_off(MasterSpecifiedInfo_T *master_specified_info, int slave_pos);
    reslave_pos参数统对应不同的轴,slave_pos=0,axis1 slave_pos=1,axis2...
6 (2) 设置不同轴的操作模式,位置 力矩,速度模式
    int interpolation_2_ecat_set_slave_operation_model(MasterSpecifiedInfo_T *master_specified_info, int slave_pos=1,axis2...
```

## Igh Master 1.5.2 源码

ethercat-1.5.2.zip

Igh Master 1.5.2 ethercat-1.5.2/源码编译安装说明文件.txt

```
herCAT 1.5.2 编译及使用说明.txt
        源码中有内核模块编译,指令定模块目录
根据实际情况修改build_ethercat-1.5.2.sh中以下几个变量:
                                                                                                                #编译输出目录
#内核模块安装目录
        kernel_source_dir='_mnt/fs_ext/imx6/linux-3.0.35' #内核源目录
lib_modules_kernel_promt='3.0.35-2666-gbdde708' #内核原本导
host=arm-fsl-linux-gnueabi #交叉编译链前缀
        11b_modules_kerne_n...
#交叉編译道前戦
kost=amm-fsl-linux-gnueabi
注意要先編译函族,然后編译threcat因为Ethercat依赖于内核通用网卡模块
以root用户运行./build_ethercat-1.5.2.sh
#编译具体根据提示选择y/n就可以了
2. 内核模块安装
开发板中执行"depmod"命令
3. output里面的其它文件放入开发板对应位置
4. 设置参数
        博成/ett/systoming/etnertad:
MASTERR_DEVICE="ee:f3:f5:c6:41:b6" #与ethercat绑定的Mac地址
DEVICE_MODULES="generic" #適用网卡姚靖generic, 其余支持网卡换成模块名字就行
     启动服务
/etc/init.d/ethercat restart
        出现以下信息表明移植成功
Shutting down EtherCAT master 1.5.2 done
Starting EtherCAT master 1.5.2 ec_generic: Binding socket to interface 3 (eth0).
     done
应用层测试
        root@linaro-ubuntu-desktop:~# ethercat
Please specify a command!
          alias Write alias addresses.
config Show slave configurations.
cstruct Generate slave PDO information in C language.
          debug Set the master's debug level.

domains Show configured domains.

download Write an SDO entry to a slave.

eoe Display Ethernet over EtherCAT statictics.

foe_write Store a file from a slave via FoE.

graph Output the bus topology as a graph.

master Show master and Ethernet device information.

pdos List Sync managers, PDO assignment and mapping.

reg_mrate Write data to a slave's registers.

reg_write Write data to a slave's registers.
           regamile white data to a lave's registrescan Rescan the bus.
sdos List SDO dictionaries.
sii_read Output a slave's SII contents.
sii_write Write SII contents to a slave.
           sii_write Write SII contents to a slave.
soe_mead Read an SoE IDN from a slave.
soe_write Write an SoE IDN to a slave.
states Request application-layer states.
upload Read an SDO entry from a slave.
version Show version information.
xml Generate slave information XML.
               --master -m <master> Comma separated list of masters
                                                          to select, ranges are allowed. Examples: '1,3', '5-7,9', '-3' Default: '-' (all).
          --force -f Force a command.
--quiet -q Output less information.
--verbose -v Output more information.
--help -h Show this help.
Call 'ethercat <COMMAND> --help' for command-specific help.
以上内容为基本的使用 ,进一步使用要结合ethercat说明文档和电机说明。
        将output目录复制到开发板然后运行output目录下install_to_arm.sh脚本
       执行6.7步骤测试自动安装是否成功
(1)Starting EtherCAT master 1.5.2 EtherCAT ERROR: MAC address may not be empty.

FATAL: Error inserting ec_master (/lib/modules/3.0.35-2666-gbdde708-gbdbf2583/mnt/hgfs/win_linux_share/linux/do.
(2)编译Ethercat 一定要保证所用编译器与内核与硬件平台一致,否则会出现内核模块不能使用或者其它未知问题
(3)内核源码要先编译通过,否则Ethercat模块将不能编译通过,因为Ethercat模块依赖于内核本身驱动模块。
```
