[MS-PSRDP]: PowerShell Remote Debugging Protocol

Intellectual Property Rights Notice for Open Specifications Documentation

- **Technical Documentation.** Microsoft publishes Open Specifications documentation for protocols, file formats, languages, standards as well as overviews of the interaction among each of these technologies.
- **Copyrights.** This documentation is covered by Microsoft copyrights. Regardless of any other terms that are contained in the terms of use for the Microsoft website that hosts this documentation, you may make copies of it in order to develop implementations of the technologies described in the Open Specifications and may distribute portions of it in your implementations using these technologies or your documentation as necessary to properly document the implementation. You may also distribute in your implementation, with or without modification, any schema, IDL's, or code samples that are included in the documentation. This permission also applies to any documents that are referenced in the Open Specifications.
- No Trade Secrets. Microsoft does not claim any trade secret rights in this documentation.
- Patents. Microsoft has patents that may cover your implementations of the technologies described in the Open Specifications. Neither this notice nor Microsoft's delivery of the documentation grants any licenses under those or any other Microsoft patents. However, a given Open Specification may be covered by Microsoft Open Specification Promise or the Community Promise. If you would prefer a written license, or if the technologies described in the Open Specifications are not covered by the Open Specifications Promise or Community Promise, as applicable, patent licenses are available by contacting ipla@microsoft.com.
- Trademarks. The names of companies and products contained in this documentation may be covered by trademarks or similar intellectual property rights. This notice does not grant any licenses under those rights. For a list of Microsoft trademarks, visit www.microsoft.com/trademarks.
- **Fictitious Names.** The example companies, organizations, products, domain names, email addresses, logos, people, places, and events depicted in this documentation are fictitious. No association with any real company, organization, product, domain name, email address, logo, person, place, or event is intended or should be inferred.

Reservation of Rights. All other rights are reserved, and this notice does not grant any rights other than specifically described above, whether by implication, estoppel, or otherwise.

Tools. The Open Specifications do not require the use of Microsoft programming tools or programming environments in order for you to develop an implementation. If you have access to Microsoft programming tools and environments you are free to take advantage of them. Certain Open Specifications are intended for use in conjunction with publicly available standard specifications and network programming art, and assumes that the reader either is familiar with the aforementioned material or has immediate access to it.

1 Introduction

This document specifies the PowerShell Remote Debugging Protocol (PSRDP).

Sections 1.8, 2, and 3 of this specification are normative and can contain the terms MAY, SHOULD, MUST, MUST NOT, and SHOULD NOT as defined in RFC 2119. Sections 1.5 and 1.9 are also normative but cannot contain those terms. All other sections and examples in this specification are informative.

1.1 Glossary

breakpoint: A temporary stopping place in executing code.

debugger: An application or function that is used to perform debugging actions.

debugging: The process of stopping and stepping through running code to analyze the behavior of the code.

remote debugging: Debugging that operates over a remote session.

remote session: A session established from a client to a server via PSRP.

MAY, SHOULD, MUST, SHOULD NOT, MUST NOT: These terms (in all caps) are used as described in [RFC2119]. All statements of optional behavior use either MAY, SHOULD, or SHOULD NOT.

1.2 References

References to Microsoft Open Specifications documentation do not include a publishing year because links are to the latest version of the documents, which are updated frequently. References to other documents include a publishing year when one is available.

1.2.1 Normative References

We conduct frequent surveys of the normative references to assure their continued availability. If you have any issue with finding a normative reference, please contact dochelp@microsoft.com. We will assist you in finding the relevant information.

[MS-PSRP] Microsoft Corporation, "PowerShell Remoting Protocol".

[RFC2119] Bradner, S., "Key words for use in RFCs to Indicate Requirement Levels", BCP 14, RFC 2119, March 1997, http://www.rfc-editor.org/rfc/rfc2119.txt

1.2.2 Informative References

None.

1.3 Overview

This protocol extends the existing PowerShell Remoting Protocol (PSRP) specified in [MS-PSRP] to support **debugging** over a **remote session**.

1.4 Relationship to Other Protocols

This protocol depends on PSRP specified in [MS-PSRP] for transport of messages between client and server.

Figure 1: Relationship of the PowerShell Remote Debugging Protocol to other protocols

1.5 Prerequisites/Preconditions

Because this protocol is a higher layer than PSRP, a remote session established over PSRP is required before this protocol can operate. The client must be aware of the **Debugger_State**, **Resume_Action**, **Debugger_Mode**, **Debugger_Breakpoint_Collection**, and **Debugger_Stop_Context** abstract data model elements, specified in section 3.2.1, on the server.

1.6 Applicability Statement

This protocol can be used only in conjunction with PSRP that has been initialized with a single runspace in its runspace pool as specified in [MS-PSRP] section 2.2.2.2 INIT_RUNSPACEPOOL Message.

1.7 Versioning and Capability Negotiation

This document covers versioning issues in the following areas:

Capability Negotiation: The client determines that the server supports **remote debugging** by looking for **Debugger_State** data returned in the PSRP APPLICATION_PRIVATE_DATA message specified in section 2.2.6, after session creation. If this data exists, the client determines that the server capability includes remote debugging support.

1.8 Vendor-Extensible Fields

None.

1.9 Standards Assignments

None.

Release: Thursday, May 15, 2014

2 Messages

2.1 Transport

Messages are transported using PSRP.

2.1.1 Transport of Client Messages

Client to server messages MUST be sent as PSRP pipeline commands as specified in [MS-PSRP] section 2.2.2.10 and section 2.2.3.11.

2.1.2 Transport of REMOTE_DEBUGGER_STATE Message

The server MUST send the REMOTE_DEBUGGER_STATE message to the client as a PSRP APPLICATION_PRIVATE_DATA message as specified in [MS-PSRP] section 2.2.2.13.

2.1.3 Transport of REMOTE_DEBUGGER_BREAKPOINT_UPDATED_EVENT Message

The server MUST send the REMOTE_DEBUGGER_BREAKPOINT_UPDATED_EVENT message to the client as a PSRP USER_EVENT message as specified in [MS-PSRP] section 2.2.2.12.

2.1.4 Transport of REMOTE_DEBUGGER_STOP_EVENT Message

The server MUST send the REMOTE_DEBUGGER_STOP_EVENT message to the client as a PSRP USER_EVENT message as specified in [MS-PSRP] section 2.2.2.12.

2.2 Message Syntax

All message data is passed using PSRP mechanisms and therefore MUST use the PSRP message syntax as specified in [MS-PSRP] section 2.2.

2.2.1 Namespaces

All message data is passed using PSRP mechanisms and therefore MUST use namespaces as specified in [MS-PSRP] section 2.2.5.

2.2.2 SET_PSDEBUGMODE Message

This message is a PSRP pipeline command sent from the client to the server.

This message MUST be sent as a PSRP pipeline command as specified in [MS-PSRP] section 2.2.2.10 and section 2.2.3.12.

The PSRP pipeline command name MUST be Set-PSDebugMode.

The PSRP pipeline command MUST take a single 32-bit argument (**Debugger_Mode**).

2.2.3 SET_PSDEBUGGERACTION Message

This message is a PSRP pipeline command message sent from the client to the server.

This message MUST be sent as a PSRP pipeline command (as specified in [MS-PSRP] section 2.2.2.10 and section 2.2.3.12).

The PSRP pipeline command name MUST be Set-PSDebuggerAction.

7/17

The PSRP pipeline command MUST take a single 32-bit argument (**Resume_Action**).

2.2.4 GET_PSDEBUGGERSTOPARGS Message

This message is a PSRP pipeline command sent from the client to the server.

This message MUST be sent as a PSRP pipeline command (as specified in [MS-PSRP] section 2.2.2.10 and section 2.2.3.12).

The PSRP pipeline command name MUST be __Get-PSDebuggerStopArgs.

The PSRP pipeline command MUST NOT take arguments.

The PSRP pipeline command MUST return a data structure containing the server **debugger** stop state (**Debugger_Stop_Context**).

2.2.5 REMOTE_DEBUGGER_STATE Message

This message is sent from the server to the client.

This message MUST be sent as the PSRP APPLICATION_PRIVATE_DATA message as specified in [MS-PSRP] section 2.2.2.13.

This message MUST contain a **Debugger_State** data structure.

The PSRP APPLICATION_PRIVATE_DATA message allows for a collection of multiple data structures to be sent from the server to the client after a successful connection is established via PSRP. This message is the same as the PSRP APPLICATION_PRIVATE_DATA message but includes the **Debugger_State** data structure as defined by a higher layer.

2.2.6 REMOTE_DEBUGGER_BREAKPOINT_UPDATED_EVENT Message

This message is sent from the server to the client.

This message MUST be sent using the PSRP USER_EVENT event mechanism specified in [MS-PSRP] section 2.2.2.12.

The PSRP USER_EVENT event name MUST be PSInternalRemoteDebuggerBreakpointUpdatedEvent.

This event message MUST contain a server **Debugger_Breakpoint_Collection** data structure.

2.2.7 REMOTE_DEBUGGER_STOP_EVENT Message

This message is sent from the server to the client.

This message MUST be sent using the PSRP USER_EVENT event mechanism specified in [MS-PSRP] section 2.2.2.12.

The PSRP USER EVENT name MUST be PSInternalRemoteDebuggerStopEvent.

This event message MUST contain a server **Debugger_Stop_Context** data structure.

3 Protocol Details

3.1 Client Details

The client can send three messages to the server.

- SET_PSDEBUGMODE (section <u>2.2.2</u>). This message is sent to the server to set the **Debugger_Mode** state on the server.
- 2. SET_PSDEBUGGERACTION (section 2.2.3). This message is sent to the server in response to a server REMOTE_DEBUGGER_STOP_EVENT message. It sets the **Resume_Action** state on the server.
- GET_PSDEBUGGERSTOPARGS (section <u>2.2.4</u>). This message queries the server for the **Debugger_Stop_Context** information.

3.1.1 Abstract Data Model

None.

3.1.2 Initialization

This protocol is initialized when a remote session is established over PSRP. After this, the client higher layer MAY $\leq 1>$ initialize the remote session for remote debugging by sending the SET PSDEBUGMODE message as specified in section 2.2.2 to the server.

3.1.3 Higher-Layer Triggered Events

- When the client sends a SET_PSDEBUGMODE message (section 2.2.2) to the server, the server uses the message argument value **Debugger_Mode** to update its state.
- When the client sends a SET_PSDEBUGGERACTION message (section 2.2.3) to the server, the server uses the message argument value Resume_Action to update its state.
- When the client sends a GET_PSDEBUGGERSTOPARGS message (section 2.2.4) to the server, the server returns the current **Debugger_Stop_Context** data to the client via the PSRP pipeline command infrastructure (as specified in [MS-PSRP] section 2.2.2.10 and section 2.2.3.12).

3.1.4 Message Processing Events and Sequencing Rules

3.1.4.1 SET_PSDEBUGMODE Message

This message is sent at the discretion of the client to set the server-side **Debugger_Mode** state.

3.1.4.2 SET_PSDEBUGGERACTION Message

This message is sent by the client in response to a server REMOTE_DEBUGGER_STOP_EVENT message as specified in section <u>2.2.7</u>. The client sends this message to set the server-side **Resume_Action** state.

3.1.4.3 GET_PSDEBUGGERSTOPARGS Message

This message is sent at the discretion of the client to retrieve the **Debugger_Stop_Context** information from the server.

9/17

3.1.5 Other Local Events

None.

3.2 Server Details

The server supports remote debugging by handling client messages and sending server state and event data to the client.

3.2.1 Abstract Data Model

This section describes a conceptual model of possible data organization that an implementation maintains to participate in this protocol. The described organization is provided to facilitate the explanation of how the protocol behaves. This document does not mandate that implementations adhere to this model as long as their external behavior is consistent with that described in this document.

Debugger_Mode: This is a 32-bit field representing the server-side debugger mode. The interpretation of this field is defined at a higher layer.

Resume_Action: This is a 32-bit field representing the action the server-side debugger takes when resuming code execution. The interpretation of this field is defined at a higher layer.

Debugger_State: This is a data structure representing the current state of the server debugger. The specific form of this data structure is defined at a higher layer.

Debugger_Breakpoint_Collection: This is a collection of data structures representing breakpoints on the server. The specific form of this data structure is defined at a higher layer.

Debugger_Stop_Context: This is a data structure that represents the server debugger stop state. The specific form of this data structure is defined at a higher layer.

3.2.2 Initialization

This protocol is initialized when a remote session is established over PSRP.

3.2.3 Higher-Layer Triggered Events

- When the remote session is first established, the server MUST send a REMOTE DEBUGGER STATE message (section 2.2.5) to the client.
- When the server receives the SET_PSDEBUGMODE message (section <u>2.2.2</u>) from the client, it MUST set the server **Debugger_Mode** state.
- When server breakpoint state changes in the remote session, the server MUST send a REMOTE_DEBUGGER_BREAKPOINT_UPDATED_EVENT message (section 2.2.6) to the client.
- When code execution is halted through debugger action in the remote session, the server MUST send a REMOTE_DEBUGGER_STOP_EVENT message (section <u>2.2.7</u>) to the client.
- When the server receives the SET_PSDEBUGGERACTION message (section <u>2.2.3</u>) from the client, it MUST set the server **Resume_Action** state.
- When the server receives the GET_PSDEBUGGERSTOPARGS message (section <u>2.2.4</u>) from the client, it MUST return the server **Debugger_Stop_Context** information.

3.2.4 Message Processing Events and Sequencing Rules

3.2.4.1 SET_PSDEBUGMODE Message

When the server receives this message, it MUST update its **Debugger_Mode** state as provided by the message argument specified in section 2.2.2.

3.2.4.2 SET_PSDEBUGGERACTION Message

When the server receives this message, it MUST update its **Resume_Action** state as provided by the message argument specified in section 2.2.3.

3.2.4.3 GET_PSDEBUGGERSTOPARGS Message

When the server receives this message, it MUST return a **Debugger_Stop_Context** data structure corresponding to its current state.

3.2.4.4 REMOTE_DEBUGGER_STATE Message

The server MUST send this message after a remote session is successfully established over PSRP as specified in section 2.2.5.

3.2.4.5 REMOTE_DEBUGGER_BREAKPOINT_UPDATED_EVENT Message

The server MUST send this message whenever its breakpoint state changes as specified in section 2.2.6.

3.2.4.6 REMOTE_DEBUGGER_STOP_EVENT Message

The server MUST send this message whenever running code is halted on the server for debugging purposes as specified in section 2.2.7.

3.2.5 Other Local Events

None.

4 Protocol Examples

A common remote debugging sequence is as follows:

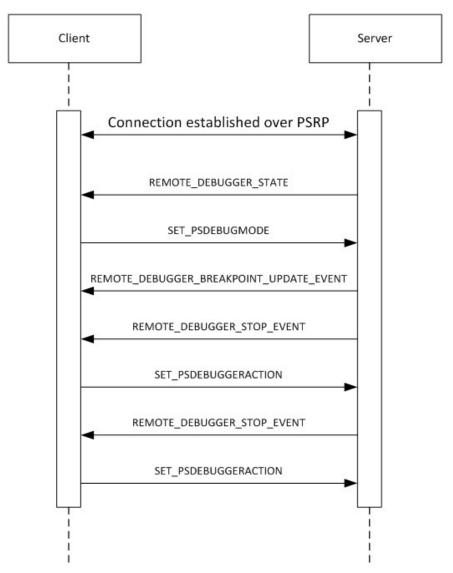

Figure 2: Common PowerShell Remote Debugging Protocol sequence

5 Security

5.1 Security Considerations for Implementers

None.

5.2 Index of Security Parameters

None.

6 Appendix A: Product Behavior

The information in this specification is applicable to the following Microsoft products or supplemental software. References to product versions include released service packs:

- Windows 7 operating system
- Windows Server 2008 R2 operating system
- Windows 8 operating system
- Windows Server 2012 operating system
- Windows 8.1 operating system
- Windows Server 2012 R2 operating system

Exceptions, if any, are noted below. If a service pack or Quick Fix Engineering (QFE) number appears with the product version, behavior changed in that service pack or QFE. The new behavior also applies to subsequent service packs of the product unless otherwise specified. If a product edition appears with the product version, behavior is different in that product edition.

Unless otherwise specified, any statement of optional behavior in this specification that is prescribed using the terms SHOULD or SHOULD NOT implies product behavior in accordance with the SHOULD or SHOULD NOT prescription. Unless otherwise specified, the term MAY implies that the product does not follow the prescription.

<1> Section 3.1.2: In Windows PowerShell, remote script debugging is opt in, therefore the server-side script debugger is created with remote debugging initially disabled. The Windows PowerShell client enables remote session debugging by sending the SET_PSDEBUGMODE message to the server.

7 Change Tracking

No table of changes is available. The document is either new or has had no changes since its last release.
